

60275
Regolith Breccia
255 grams

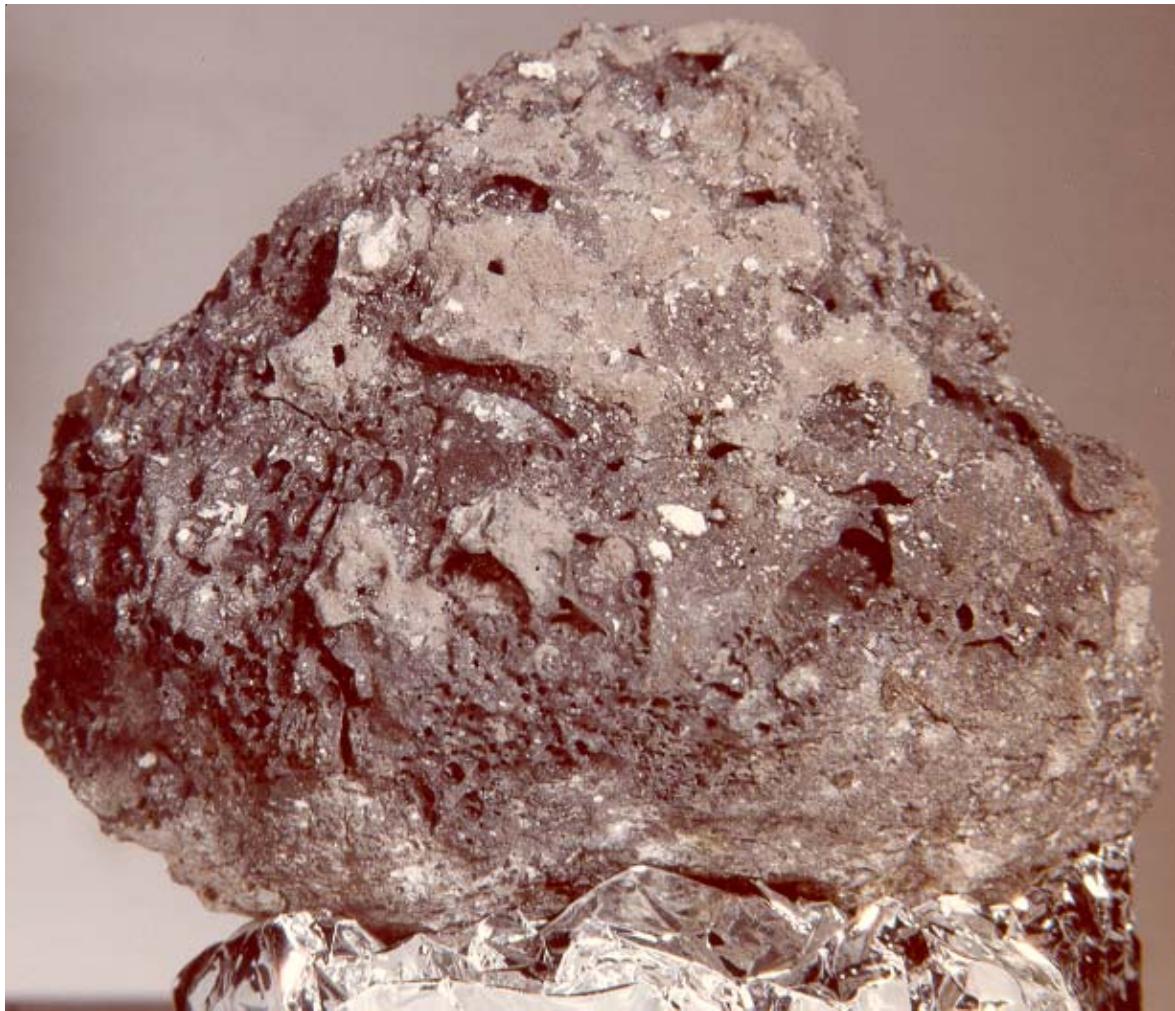

Figure 1: Photo of 602275. NASA S72-43230.

Introduction

Lunar sample 60275 is a glass coated regolith breccia (figure 1). One side has had the glass coating chipped off by micrometeorite bombardment. (figure 2).

Petrography

Fruland (1983) identified 60275 a glass matrix soil breccia, and, according to Simon et al. (1988), 60275 is a “young” regolith breccia. However, it has a low maturity index ($\text{Is}/\text{FeO} = 4$, McKay et al. 1986). It is clast rich, with numerous white clasts set in dark matrix.

Mineralogical Mode for 60275

(from Simon et al. 1988)

	20-90 micron	90-1000 micron
Matrix < 20 micron	51.2 %	
Mare basalt	0	0.2
KREEP basalt	0	0.6
Feldspathic basalt	0	0
Plutonic rock frag.	0.2	3
Granulite	0	0
Poik. rocks	0.7	7.5
Impact melts	1	6.2
Regolith brec.	0	0
Agglutinate	0	2.6
Plagioclase	6.3	8.5
Olivine	0.8	0.2
Pyroxene	1.7	0.4
Opaques	0	0.2
Glass	2.8	4.6

Chemistry

Christian et al. (1976), McKay et al. (1986), Simon et al. (1988) and Clark and Keith (1973) all analyzed portions of 60275 (table 1). 60275 is aluminous with abundant feldspar. It has a composition similar to Apollo 16 soil (figure 4). Meteoritic siderophiles are high.

Cosmogenic isotopes and exposure ages

Clark and Keith (1973) determined the cosmic-ray-induced activity of ^{26}Al = 129 dpm/kg., ^{22}Na = 48 dpm/kg. and ^{54}Mn = 6 dpm/kg.

McKay et al. (1986) and Bernatowitz et al. (1978) determined the rare gas content and isotopic ratios. There is excess ^{129}Xe as well as unsupported fission Xe.

Processing

A slab was cut from 60275 (figure 6). There are 19 thin sections.
